Final Project

How have we met the requirements?

Our site aims to educate people with a little bit or no knowledge about back doors in software. We aimed for it to be a progression where you read one section, then you read the second section which would lead to a person having enough knowledge to answer our quiz. For usability, our website clearly states where each button goes and we used the specific `<nav></nav>` element so that screen readers can also know where the navigation is. For educational value, Since the personas that we have decided fit our website mostly know little to nothing about the topic, we have stuck to things that are easier to understand. Even someone with no idea about the topic can understand most of what we said. For interactivity, we decided to add a quiz! The quiz gives instant feedback and the only thing that happens if you get a wrong answer is it shows you and lets you try again. The quiz is coded in such a way that it is infinitely scaleable so if we wanted to add more questions, we would just copy and paste the HTML, while the CSS sheets and the JS do the rest. As for esthetics, we wanted to make sure that almost everyone would be able to see our page and be able to read it. This is why we went with a grayscale background, due to us knowing that the black text on a light gray background would clearly be visible. All the pages follow the same color scheme which is also cool. The clip art used for the quiz's "X" and "Check" and the logo was made by Matthew.
